Abstract (en)

[origin: WO2015067671A1] The invention relates to a container closure with a flange (01), which is made of plastic and has a deformable securing section (06) on a container side, and with a lid (10), which is removably attached to a dispensing opening (02) of the flange (01). The securing section comprises a radially outer-lying sealing bead (07) and a circumferential expanding gap (08). The lid comprises a closure surface (11) and an outer sleeve (12) adjoining said closure surface. An expanding element (13) presses the sealing bead (07) radially outwards in order to move the groove (09) over the edge of an opening (05) of a container (03) when the container closure is inserted into the opening. The invention further relates to a container with an opening (05) in an opening surface (04), such a container closure being attached in the opening (05).
