Abstract (en)  
[origin: WO2015049226A1] The invention relates to a container comprising a container body (2) which has a container wall (3) and a holding space (4) for a packaged product (5), wherein the container has a dispensing opening (6) for dispensing the packaged product (5) and a container closure (10) for closing the dispensing opening (6), wherein the container closure (10) has a lid (12) which can assume a closed position in which the lid (12) closes the dispensing opening (6), and wherein the lid (12) can be moved from the closed position to an open position in which the dispensing opening (6) is open. The container is provided with a child-resistant lock (30) which has a first locking element (18) that is arranged on the lid (12) and cooperates with a second locking element (19) provided on the container, wherein the first and second locking element (18, 19) can assume in relation to one another a locking position in which the lid (12) is fixed in the closed position, and wherein the first and second locking element (18, 19) are movable relative to one another from the locking position into a release position in which the lid (12) can be moved into the open position. Also provided is an actuating element (20) which can be moved from a rest position into an actuating position in order to move the first and second locking element (18, 19) relative to one another from the locking position into the release position. The invention is characterized in that the second locking element (19) is arranged outside the container wall (2) and at a radial spacing from the container wall (3).
