Abstract (en)  
A slide rail assembly (20) includes first and second rails (26, 30), a running carriage (36), a correction mechanism (34), and an actuator (40). The running carriage (36) is slidably mounted on the first rail (26), carries the second rail (30), and, when the second rail (30) is longitudinally displaced relative to the first rail (26), is differentially moved relative to the second rail (30). The correction mechanism (34) is mounted on the first rail (26) and includes an action member (44) and a pushing member (42) movably connected to the action member (44). The actuator (40) is connected to the second rail (30). Should a differential movement error of the running carriage (36) occur, the actuator (40) drives the action member (44) while the second rail (30) is being extended, thereby displacing the pushing member (42), and hence the running carriage (36), so as to correct the error.
