Abstract (en)
[origin: WO2015055964A1] An applicator device comprising a tubular base (3), a sleeve (4) mounted rotating on the tubular base between a storage position and a use position, a shutter (5) designed to close the sleeve, a manoeuvring mechanism (6) comprising first and second parts (34, 40) rotatably mounted relative to each other, and a cup (32) carrying a stick of product (7), the first and second parts being driven in rotation respectively with the tubular base and the sleeve and being designed to move the cup axially when the sleeve rotates on the tubular base. The first and second parts of the manoeuvring mechanism are mounted axially sliding respectively relative to the tubular base and to the sleeve, and are moved axially in the outlet direction of the stick of product when the sleeve is rotated towards the storage position from an intermediate angular position.
