Abstract (en)

[origin: WO2015055822A1] The invention relates to a method for producing an at least partially enameled component. The problem addressed by the invention is that of providing a method that enables especially high product quality while energy consumption is kept especially low and ecological damage is kept low. This problem is solved in that a workpiece (2) bearing an enamel powder is inductively heated, wherein the operating frequency of the inductor (4) is selected with regard to the material properties of the workpiece (2) in such a way that an electromagnetic depth of penetration in the workpiece (2) is at most 1 mm.
