Abstract (en)

[origin: CA2925202A1] A method for continuously clarifying a flowable suspension (P) with a centrifuge, in particular a discontinuously solid-discharging - self-discharging - separator, which has a rotatable drum with a vertical axis of rotation, a feed for the suspension (P) to be clarified and at least one liquid discharge for continuously discharging at least one clarified liquid phase (L), and discontinuously openable solid-discharge openings for discontinuously discharging the solid phase (S), comprises the following steps: a) measuring one or more of the suspension parameters mass, mass of solid substance in the suspension, mass flow, temperature, density, cumulative density; and b) initiating a time-limited discharge of solid substance as a result of a repeated determination on the basis of step a) in the event of or after the exceeding of a limit value.
