Abstract (en)

[origin: WO2015060713A1] The invention relates to an in-mould label positioning device adapted to position a label inside a mould cavity of a plastic moulding device. The in-mould label positioning device comprises a positioning table, which defines a position for a label with the backside of the label faces away from the table surface, a transfer head moveable between a label-receiving position outside the mould cavity and a label release position inside the mould cavity, and a transfer device, adapted to transfer the label from the positioning table to the transfer head. The transfer device is adapted to pick up the label from the positioning table by engaging the back side of the label, and to engage the front side of the label to dispense the label onto the transfer head with the front side of the label facing away from an outer wall of the transfer head.
