Abstract (en)  
[origin: WO2015090933A1] According to the invention, a balise at the border of a trusted area, in particular a TAB balise, communicates data to a rail vehicle when the rail vehicle passes said balise, the rail vehicle verifies a condition on the basis of said data, and the rail vehicle performs a predefined action in accordance with whether the condition is met. This dispenses with the need for additional balises, especially TAO balises.
