Abstract (en)

[origin: WO2015059294A1] The invention relates to a light-emitting device (100) comprising: a light-emitting diode (102) having an emitting layer comprising a ternary or quaternary semiconductor including a chemical element from column 13 of the periodic table of elements, from among Al, Ga and In, and having an atomic composition that varies over the thickness of the emitting layer, and/or at least two emitting layers each comprising such a semiconductor, the atomic compositions of the element being different from one layer to another; a device (108) for detecting a wavelength and intensity of a light emitted by the diode; a switched-mode electric power supply (110) which can supply the diode with a periodic signal having a duty factor α ; a device (111) for controlling the switched-mode electric power supply, which can alter α and a peak value of the periodic signal according to detected values and target values.
