Abstract (en)
[origin: WO2015121881A1] A capsule (1) is described, for preparing infusion beverages, in particular coffee, chocolate milk and other soluble substances, comprising a containing body (3) having a base (5), the body (3) comprising an internal volume (V) adapted to contain a substance to be infused or melted, the base (5) being equipped with an outlet nozzle (4) of the beverage from the internal volume (V) and being equipped with a dripping-preventing system comprising an internal surface equipped with a relief (7', 7'', 7''') internally surrounding the nozzle (4), which is equipped with one or more openings (9', 9'', 9''') adapted to allow a passage of a flow (F) of the beverage from the internal volume (V) of the containing body (3) to the nozzle (4) under the action of a pressure exerted by an infusion flow delivered by an infusing assembly of a preparing machine and to prevent, due to a capillarity effect, a passage of liquids from the volume (V) of the body (3) to the nozzle (4) when the pressure decreases below a threshold value.
