Abstract (en)

[origin: WO2015062816A1] The invention relates to a method for providing an event message with respect to an imminent event for a vehicle. In a first step, a first event message and a second event message are first of all received. In this case, the first event message represents a signal output by a first mobile terminal (130) in response to the imminent event and the second event message represents a signal output by a second mobile terminal (135) in response to the imminent event. In a further step, an aggregated event message is created using the first event message and the second event message. This is followed by a step of determining a plausibility value for checking the plausibility of the aggregated event message. Finally, the aggregated event message and the plausibility value are output. In this case, the aggregated event message and the plausibility value represent a signal which can be received by at least one mobile playback device (140, 145).
