Abstract (en)

[origin: EP3065507A1] There are provided a driver device for light-emitting means, as well as a method for operating a driver device for light-emitting means. The method comprises: - producing a bus voltage on a galvanically isolated secondary side of the driver device, - utilizing feedback from the secondary side to a primary side of the driver device to make a primary side controller decrease said bus voltage during standby mode, and - implementing, through actions of said primary side controller, at least one further standby mode function on the primary side as a response to a decreasing value of said bus voltage.
