Abstract (en)

[origin: WO2015069940A1] Tools and techniques for estimating and/or predicting a patient's current and/or future blood pressure. In some cases, the tools will analyze physiological data captured from the patient against a model of blood pressure values to estimate/predict the patient's blood pressure value. In particular cases, derived parameters, such as a patient's compensatory reserve index ("CRI") can be analyzed against such models, while in other cases, data captured from sensors can be directly analyzed against such models.
