Abstract (en)

[origin: WO2015091257A1] The invention relates to a method for air conditioning a vehicle, in particular a rail vehicle, in which a first air flow is generated by an air conditioning system for air conditioning an interior, as a result of which the interior of the vehicle is fed cooled air as feed air in a cooling mode and is fed heated air as feed air in a heating mode, wherein a second air flow generated by an additional air circulating device is fed to the interior of the vehicle in such a way that the second air flow influences the first air flow, in particular with regard to flow direction and flow intensity. The invention also relates to a vehicle, in particular a rail vehicle, comprising an interior, an air conditioning system and an additional air circulating device, wherein a second air flow influences a first air flow, in particular with regard to flow direction and flow intensity.
