Abstract (en)
[origin: WO2015068109A1] A treatment method for treating textile articles, comprising a washing procedure (A) that minimizes the formation of wrinkles on the articles. The washing procedure (A) is implemented by a washing machine (1) comprising a washing compartment (2) in which a drum (3) designed to hold the textile articles to be washed can rotate. The washing procedure (A) comprises the steps of: • -inserting (A1) an amount of washing liquid into the washing compartment (2); the insertion (A1) of said amount of washing liquid taking place, at least in part, simultaneously with the rotation of the drum (3); said amount of washing liquid being greater than 5 litres per kilogram of textile articles to be washed; • -heating (A2) the washing liquid, the washing liquid remaining at an average temperature lower than 40 °C for the entire duration of the washing procedure (A); • -executing a plurality of intervals in which the drum (3) rotates at a rotation speed exceeding 100 revolutions/min, each of said intervals being of a duration of less than 1 minute.
