Abstract (en)

[origin: CN105971432A] The invention relates to a device for automatically opening and/or closing a rotary wing; the device comprises a wing part, a wall side part and a movable lever unit; the lever unit can connect the wing part with the wall side part, so the wing part and the wall side part can move towards to or backwards against each other through the lever, thus opening or closing the wing; the wall side part or the wing part are movably supporting a shield member; the shield member can at least partially cover the visible sides of the lever unit and/or wing in the first position, and can move outside a motion path of the lever unit of the wing in the second position.
