Abstract (en)
[origin: EP3067903A1] In an electromagnetic induction apparatus, coil portions, each including a wiring pattern on a printed wiring board and a metal member having both end portions connected to the wiring pattern, are electrically connected to each other and arranged side by side to form a coil body. Therefore, for example, by mounting cooling means onto the printed wiring board, heat can be efficiently radiated from the coil body to enable reduction in thermal resistance.
