Abstract (en)
[origin: WO2015071033A1] Method for modifying a driving simulator, wherein during at least one time segment of an actual journey, a temporal progression (1) of a biometric state of the athlete is determined, at least one temporal progression of a parameter (5) is thereby determined for one vehicle used by the athlete, a relationship is determined between the temporal progression (1) of the biometric state of the athlete and the temporal progression of the parameter (5) of the vehicle, which relationship indicates the temporal change of the biometric state depending on the temporal progression of the parameter (5), during a first training in the driving simulator, an attuning temporal training progression (2) of a biometric state of the athlete is determined, and, during a further, second training in the driving simulator, the temporal training progression (7) of the biometric state of the athlete, modified by mental stimulation of the athlete depending on the determined relationship, can be more closely approximated to the temporal progression (1) of the biometric state of the athlete during the actual journey.
