Abstract (en)

[origin: WO2015067449A1] The invention relates to a device for securing an antenna arrangement on a surface in the correct position, said surface having a recess for an antenna connection means. The antenna arrangement has a base plate from which the connection means extends to the recess. The connection means comprises a clamping plate which is secured from being lost and a screw or a screw bolt such that the clamping plate can be axially moved in the direction of the base plate and clamped by means of the screw or screw bolt. In a first embodiment according to the invention, the width of the recess substantially equals the width of the clamping plate, and the length of the recess is smaller than the length of the clamping plate such that the connection means can be immersed into the recess in a circular arcing manner and subsequently clamped.
