Abstract (en)
The present invention relates to a key storing device (1) for being arranged at a door (3), said key storing device (1) comprising a movable member (5), a stationary member (9), and a latching arrangement (19) for locking the movable member (5) to the stationary member (9) to prevent unauthorized access to a key storage space (11) within the key storing device (1). The latching arrangement (19) comprises a locking latch (21) which is normally biased to a latching position, in which it prevents opening of the key storing device (1), and a guiding surface (49) which is configured to, upon movement of at least a part of said movable member (5) from an outer position to an inner position, interact with an abutment (51) and direct the locking latch (21) from said latching position to a non-latching position, wherein said key storing device (1) further comprises a holding device (31) which is operable by a key system (53) and arranged to hold the locking latch (21) in a non-latching position, thereby enabling opening of the key storing device (1) to provide access to a key (15) stored in the key storage space (11).
