Abstract (en)

[origin: WO2015075208A1] The invention relates to a data line (2) which is designed in particular as a coaxial cable and comprises a line core that extends in a line longitudinal direction (14). The line core has at least one conductor (4) surrounded at least by insulation (6) and is surrounded by a multi-layer shielding foil (8), which has a non-conductive layer (16) and a conductive layer (18a, 18b). In an overlap region (12), a free end edge (20) overlaps a further partial region (22), wherein additionally a conductive connection of the conductive layer (18a, 18b) at the end edge (20) to the further partial region (22) is formed such that a transverse current flow perpendicular to the longitudinal direction (14) within the conductive layer (18a, 18b) is enabled. The conductive connection is formed optionally as a conductive strip (24) and/or by a beveled end edge (20). In particular, the data line (2) is a data line (2) shielded exclusively by means of the shielding foil (8). The data line is used in particular in a motor-vehicle electrical system.
