Abstract (en)

[origin: WO2015077809A1] The invention relates to a LED module (1), comprising - connections (2) for a LED path (3); - a circuit (4) which is configured to produce a load, preferably an effective power load, if during a starting phase a constant current is applied to the LED module (1), and which is configured not to produce a load when the starting phase has finished, wherein the circuit (4) is designed to produce a variable-current load which effects a change in the power consumption of the LED module (1) according to at least one predetermined protocol.
