Abstract (en)
A method for manufacturing a protection device and a respective protection device are described. The method envisages designing a lattice body comprising a plurality of cells (15) or internally hollow units or units having a cavity. The method envisages increasing the energy absorption capacity of one or more zones of said lattice body (12) by subdividing one or more cells (15) of said one or more zones of the lattice body (12) into two or more cell fractions, or filling at least a part of the cavity (16) of one or more of said cells (15) of said one or more zones of the lattice body (12).
