Abstract (en)  
A lacing system for a shoe is disclosed. The lacing system for a shoe, according to the present invention, is a lacing system utilized for tying purposes so as to be coupled to string lacing eyelets of a dress shoe or a sneaker such that a shoe is firmly worn on the foot, and the lacing system for a shoe comprises: a body having elasticity; and hook portions which are respectively formed on both end portions of the body, and which are fastened by being inserted into the string coupling holes. Accordingly, the hook portions formed on both ends of the elastic body are coupled by being inserted and hooked into the string lacing eyelets when a dress shoe or a sneaker is worn such that the body is firmly fastened so as to prevent untying, and since the simple lacing of a shoe is possible, it is not necessary to tie a string knot as in conventional methods so as to provide ease of use and to enable a user to quickly put on shoes.
