Abstract (en)

[origin: EP3075933A1] The present invention relates to a unit (1',1'') for moving a door (51,52) of a furnishing element (2). The unit comprises a supporting bracket (12) connectable to said door (51,52) and a wheel (5) slidably connected to the bracket. The unit further comprises a mechanism for adjusting the position of the bracket (12) with respect to the rotation axis (101) of the wheel (5). Such a mechanism comprises a first activation element (10) and a guiding element (20) for the movement of said bracket (12) with respect to said wheel (5). Said guiding element (20) is rotationally connected to the bracket (12) to rotate about a rotation axis (103) parallel to the rotation axis (101) of the wheel (5). The guiding element (8) and the activation element (10) are operatively connected so that a rotation of said activation element (10) determines a corresponding rotation of said guiding element (8).
