Abstract (en)

[origin: WO2015042582A1] A device that secures to a beverage can top includes a rim section that includes an inner edge that resides adjacent to the central panel of the can top. A central cover is secured to the can top at the inner edge of the rim section. The central cover extends over the top of a central panel of the can top and covers a tab and openable section of the can top. The central cover is removable from the rim section at a releasable boundary defined at the inner edge of the rim section. The underside of the central cover supports promotions that are not visible until removal of the central cover when the can is opened.
