Abstract (en)

[origin: WO2015083084A1] The present invention relates to a thermally-insulating composite elevation panel, characterised in that it comprises an elevation board (1) and a frame (3), preferably a metal one, which are permanently connected to each other through an insulating layer (2), the insulating layer being constituted by a plastic foam which, during its foaming process, permanently connects the elevation panel (1) with the frame (3). The invention relates also to a method for performing thereof and its use for simultaneous mounting of elevations and thermal insulation of buildings, especially high buildings.
