Abstract (en)

[origin: WO2015086252A1] The invention relates to a device (10) on an elevator system (100) having a counterweight (1), which counterweight can be moved into an end position from an arbitrary operating position. The device (10) has at least one, in particular transparent, shielding segment (12), which is arranged in a stationary manner at a distance from the counterweight (1) in the end position, on which shielding segment (12) at least one sighting device (10) is arranged. The sighting device (10) is arranged in such a way that the position of the counterweight in relation to at least one comparison position can be determined by sighting a bottom edge of the counter weight (1) or a marking on the counterweight (1).
