Abstract (en)

[origin: WO2015085336A2] The invention relates to a device for closing a building opening, wherein a planar closure element and/or a frame rigidly attached to the edge of the building opening has a frame profile (1, 29, 39, 43, 72, 77, 90, 94), which by way of two lateral surfaces (4) delimits a profile cavity (2, 74, 78) that is open toward the rebate face, wherein from each of the two lateral surfaces (4), a profile wall (5, 79) projects toward the direction of the respective other lateral surface (4). On said projecting profile walls (5, 79), a metal cover plate (17, 36, 68, 85, 87, 106) and a clamping part (11, 35, 84, 103) are attached such that they are pulled together by screws (16, 24), with the interposition of the profile walls (5, 79). On the two projecting profile walls (5, 79), the clamping part (11, 35, 84, 103) abuts, in each case, both flanks of a groove (6), the opening surface of which is parallel to the connecting surface between the two projecting profile walls (5, 79).
