Abstract (en)
[origin: WO2015091423A1] Disclosed is a driving-in device comprising a hand-held housing (1) in which a piston member (2) is accommodated to transmit energy to a fastening element to be driven in, an especially replaceable propellant charge, and a combustion chamber (3) which is located between the propellant charge and the piston member (2) and which extends in particular around a central axis (A), and a control element (104) which allows the energy transmitted from the propellant charge to the piston member (2) to be variably modified. Said driving-in device is characterized in that a movable sliding element (105) of the control element (104) forms a section of a sidewall (101) of the combustion chamber (3), said section adjoining the piston member (2).
