Abstract (en)
[origin: WO2015090690A1] The invention relates to a closure (1) which is intended for a container (16) and comprises a base part (3), which can be fastened on the container (16), and a hinged lid (2), which is connected to the base part (3) so as to be pivotable about a pivot axis (5), closes a closure opening of the base part (3) in a closure position and has a lid roof (6) bounded by a periphery (7), wherein the hinged lid (2) has a pressure-exerting region (14) in the front part, so that the hinged lid (2) can be pushed out of the closure position by a certain amount of opening force (Fo) being applied by a finger. The closure according to the invention is distinguished in that a supporting region (17) is defined in a rear part of the hinged lid (2), this supporting region establishing the position for another finger, by means of which the hinged lid (2) can be subjected to a counter-force (FG), acting substantially in the direction counter to the opening force (Fo).
