Abstract (en)

[origin: US2015167221A1] A method of washing particulate laden material in a washer includes moving the particulate laden material from the intake of the washer to the discharge of the washer and through multiple modules or sectors. Liquid can be counter flowed in the washer interior along a flow path that is generally opposite the direction of travel of the particulate laden material. A specially configured recirculation/filtration arrangement removes a majority of particulate and organic matter from the washing fluid.
