Abstract (en)
[origin: WO2015091704A1] The invention relates to a fuse holder (1) comprising two housing elements (4, 5) which, once assembled, together form a tube in which a fuse (10) is accommodated. One of the elements of housing (4, 5) includes a base (4a) extending longitudinally along the direction of assembly (A) of the two housing elements (4, 5) with each other. A seal (11) is placed on the base (4a) mainly in a plane perpendicular to the direction of assembly (A). During assembly, the other housing element is brought to at least partially cover the base (4a) to sandwich the seal (11) between the two housing elements (4, 5). A rim (4c) extends around the base (4a) in the direction of assembly (A) in order to protect the seal (11) until the two housing elements (4, 5) are assembled together.
