Abstract (en)

[origin: EP3086104A1] A holding device (1) for a rim of a vehicle wheel, comprising a base plate (2), a plurality of retaining elements (10), a synchronization element (30), and a locking element (20) for locking a rotational position of at least one of the plurality of retaining elements (10) or the synchronization element (30). The plurality of retaining elements (10) and the synchronization element (30) comprise corresponding coupling portions (15, 35) for form-fitting coupling of the rotational movement of the plurality of retaining elements (10) and the synchronization element (30). Any one of the synchronization element (30) or at least one of the plurality of retaining elements (10) comprises an elastic coupling portion (17), biasing the corresponding coupling portions (15, 35) of the synchronization element (30) and the retaining elements (10) towards each other for ensuring the form-fitting coupling of the synchronization element (30) and the plurality of retaining elements (10).
