Abstract (en)
[origin: US2015173438A1] A process for producing a safety glove to be worn on a conventional human hand and where the glove is of a conventional material. A glove is obtained as a unitary construct having glove finger sections to each respectively cover one finger of the hand, a glove palm section to cover the palm, and a glove back section to cover at least part of the backhand. In each glove finger section a separation zone is formed by controllably weakening the material of the glove such that all or part of the respective glove finger section is separable from the rest of the glove, wherein the separation zone retains a discernible thickness throughout.
