Abstract (en)
[origin: WO2015097024A1] The invention relates to a dental prosthesis arrangement composed of at least one jaw implant with a superstructure, which are connected to each other in a connection portion via a lower part assigned to the jaw implant and an upper part assigned to the superstructure. In the connection portion, the lower part engages in the upper part along a central axis. The lower part is supported against the upper part at several contact faces. The lower part and the upper part are connected releasably to each other via a securing means which provides a retaining force against axial withdrawal of the upper part from the lower part, wherein different securing means can be selected if a first radially inwardly directed structure is provided on the lower part and a second radially outwardly directed structure is provided on the upper part for receiving a holding element and can be fixed by at least one further element passing through the upper part and connected to the lower part.
