Abstract (en)

[origin: US2016316924A1] The invention relates to a one-piece suspension device for interposing between a mattress and a support structure. The device includes a platform defining a bearing plane for the mattress, a fastener point for fastening to the support structure, and a resilient section. The resilient section is more resilient than the platform in a direction perpendicular to the bearing plane and it is interposed between the platform and the fastener point in the direction perpendicular to the bearing plane to absorb compression forces. The one-piece suspension device is shaped such that any axis perpendicular to the bearing plane and passing through the one-piece suspension device intersects the one-piece suspension device along a single intersection segment. The resilient section has at least two elastic hinges with different flexibilities.

Abstract (fr)

L'invention concerne un dispositif monobloc de suspension (2) destiné à être interposé entre un matelas et une structure de support (10), comprenant un plateau (3) définissant un plan d'appui (A) du matelas, un point de fixation à la structure de support (10), et une section élastique (6). Cette section élastique (6) est plus élastique que le plateau (3) en direction perpendiculaire au plan d'appui (A) et est interposée entre le plateau (3) et le point de fixation dans la direction perpendiculaire au plan d'appui (A) pour absorber des efforts de compression. Le dispositif monobloc de suspension (2) est conformé de telle manière que tout axe (Z 1 , Z 2) perpendiculaire audit plan d'appui (A) traversant le dispositif monobloc de suspension (2) intersecte le dispositif monobloc de suspension (2) sur un seul segment d'intersection (S 1 ,S 2). La section élastique comprend au moins deux charnières élastiques (9c, 9d) à flexibilités différentes.
