Abstract (en)
Disclosed is a cladding system (15) for being connect to a wall surface (16). The cladding system (15) comprises a first mounting rail (1) comprising a front flange (2), wherein a first longitudinal edge (17) of the front flange (2) is connected to a mounting flange (4) through a spacing flange (5) being inclined in relation to the front flange (2). A second longitudinal edge (18) of the front flange (2) is connected to a support flange (6) also being inclined in relation to the front flange (2) and the mounting flange (4) is suited for being connected to the wall surface (16). The cladding system (15) further comprises a second mounting rail (14) comprising a front flange (2), wherein a first longitudinal edge (17) of the front flange (2) is connected to a mounting flange (4) through a spacing flange (5) being inclined in relation to the front flange (2). A second longitudinal edge (18) of the front flange (2) is connected to a support flange (6) also being inclined in relation to the front flange (2) and wherein the mounting flange (4) is suited for being connected to the wall surface (16). The first mounting rail (1) is connected to the second mounting rail (14) at the first longitudinal edge (17) of the first mounting rail (1) and at the second longitudinal edge (18) of the second mounting rail (14) so that the mounting flange (4) of the first mounting rail (1) is substantially covered at least by the front flange (2) of the second mounting rail (14) as seen in a direction towards the wall surface (16). A method for cladding a wall surface (16) by means of a cladding system (15) is also disclosed.
