Abstract (en)
[origin: EP3091161A1] A damper (100) for slowing down the closing movement of a sliding door (20) is provided. The damper (100) comprises a damper housing (130), a damping member (110), and a latch (120) being guided by the damping member (110) relative the housing (130) along a first guiding track (140), wherein the latch (120) protrudes outside the housing (130) when moving along the first guiding track (140) and being, when moving along the first guiding track (140), adapted for receiving a lug (17) of an associated guiding profile (16). The first guiding track (140) is connected to a second guiding track (150) being non-parallel to the first guiding track (140), and the latch (120) is moveable from the first guiding track (140) to an end position (170) being defined by said second guiding track (150) and in which end position (170) the latch (120) is at least to some extent retracted into the housing (130) and is adapted to be out of contact with the guiding profile (16).
