Abstract (en)

[origin: WO2015107438A1] The invention relates to a container (1) with a base (2) and lateral walls (3), comprising a device for dividing the interior of the container (1). According to the invention, the device has a groove (4) at each opposing lateral wall and a partition (5). Each groove (4) extends from the upper edge of the lateral wall (3) over a part of the height of the lateral wall (3). In particular, each groove (4) and the end faces (6) of the partition (5) have a cross-sectional shape transverse to their longitudinal extension, the end face (6) of the partition (5) and each groove (4) being combinable in a form-fit connection by means of the cross-sectional shape. In one embodiment, each groove has an undercut. The device is characterized by consisting of only two elements. In this manner, the partitions can be introduced easily and quickly and the device can be produced inexpensively. Additionally, the container is easier to clean.
