Abstract (en)

[origin: WO2015109374A1] The method and system concern telecommunications and can be used by all subscribers and users of digital, mobile, satellite, computer, network and internet devices connectable through digital voice communication systems. A connection is established between a digital voice communication device (2) of a calling user and a digital voice communication device (3) of a called user via at least one digital voice communication system (1) for the purpose of ringing/calling the called user's device (3). According to the method, the calling user selects, using the digital voice communication device (2) and via a directory module (5), a certain name of a called user featured in the directory module (5). Once a connection has been established with the digital voice communication device (3) of the called user, a protection module (8) instructs a payment module (4) to perform reward actions and the calling user receives a reward for the call via the payment module (4). The communication system includes a payment module (4) that has the capability to perform actions to reward the calling user for the conducted conversation and a protection module (8) that has the capability to instruct the payment module (4) whether reward actions should be performed. The payment module (4) and protection module (8) constitute a computer running software or are part of a server or data storage device running or used by software, as well as part of a data storage device or integrated circuit (microchip) running or used by software, as well as part of an integrated circuit.
