Abstract (en)

[origin: WO2015113706A1] The invention relates to a method and a device for sampling a metal strip (1, 14) which is hot-rolled in a hot-rolling train using a hot rolling process and which is wound into a collar (9, 16) using a winding process. The invention is characterized in that the sample (11) is extracted from an end region of the hot-rolled metal strip (1) after the hot rolling process has been concluded, before the initial coiling process of the completely hot-rolled metal strip has been concluded in the hot-rolling train, and after the end of the hot-rolled metal strip has left the pass line of the hot rolling process.
