Abstract (en)
[origin: WO2015110662A1] The invention relates to a device for unloading bulk material, which comprises a plurality of elongate retaining elements (12, 14) extending parallel to one another in a longitudinal direction (X), forming a support surface (16) for the material, intended for being in contact with the material, in which the retaining elements (12, 14) are arranged next to one another in a transverse direction (Y) perpendicular to the longitudinal direction (X) while also defining interstices therebetween, intended for allowing the flow by gravity of at least one portion of the material, in which at least two retaining elements (12, 14) are translatably movable relative to one another in the longitudinal direction (X). The invention can be used in a storage silo or in a biomass roasting column.
