Abstract (en)
[origin: WO2015115947A1] It is presented a method for providing data to a wireless device in a cellular communication network comprising a plurality of radio cells. The method is performed in a data provider device and comprises the steps of: predicting a set of potential future locations of the wireless device; predicting future data transfer capacity at the set of potential future locations; and preloading data to the wireless device at a first time when an expected transfer capacity is greater than a desired data transfer capacity, and when a data transfer capacity at a second time after the first time is predicted to be less than a desired data transfer capacity.
