Abstract (en)
[origin: WO2015117882A1] The invention relates to a modular trigger device (100), in particular for the laboratory field, comprising a housing which surrounds an area (210) and which comprises lateral walls and a cover wall (180). At least one of the lateral walls comprises a window slide (150). The walls comprise profiled elements (120, 130) between which plate elements are removably arranged. At least one of the profiled elements (130, 140) is designed in multiple parts (profiled arrangement 130) in order to form a vertical channel which is used to receive operating elements of the trigger device (100). At least one lateral wall is designed such that another trigger device (100) can be arranged such that an area (210) is produced which is surrounded by the two trigger devices (100).
