Abstract (en)

[origin: CA2942622A1] The invention relates to a cartridge with a receiving chamber which extends in the longitudinal direction for a medium to be dispensed, comprising a head part and a cartridge wall which delimit the receiving chamber. The head part has an outlet for the medium. The cartridge wall is designed as a film at least in some regions, and the head part is designed as a dimensionally stable part. The head part is sealingly connected to the cartridge wall in particular in a non-releasable manner, and the cartridge is designed as a collapsible cartridge, i.e. the cartridge can be converted from an expanded state in which the receiving chamber has a maximum volume into a collapsed state in which the receiving chamber has a minimum volume. The cartridge which has not yet been filled with the medium is in the collapsed state. The invention further relates to a method for producing such a cartridge.
