Abstract (en)  
[origin: WO2015114526A1] The system (10) comprises: an actuator or motor (14) to be fixed on a wall (P); a rotary element (16), to be constrained to a leaf (A) and which can be caused to rotate around an operating axis (X-X) by means of the actuator or motor (14) so as to cause said leaf (A) to move in order to open and/or close an opening (F); and an electric battery (70), which is able to supply power to said actuator or motor device (14). The system comprises, furthermore, disengageable drive means (18) comprising a driving portion (20) and a driven portion (22), which cooperate in rotation with the actuator or motor device (14) and, respectively, with the rotary element (16) and are able to assume: a disengaged condition, in which they are mutually independent in rotation and can be moved relative to one another among a plurality of predetermined mutual arrangements, each one of the mutual arrangements corresponding to an associated angular position that can be assumed by the leaf (A) relative to the opening (F); and an engaged position, in which they cooperate in rotation with one another and are locked in a mutual arrangement that can be selected among said plurality of predetermined mutual arrangements.
