Abstract (en)
[origin: WO2015118004A1] The invention relates to a container cooling shelf comprising at least one cooling air channel running widely through a rear wall unit (4) and a top unit (6), with a floor region receiving a rolling container and with side wall units (5), wherein cooling air is guided to circulate through the cooling air channel, through a cooling air curtain running from top to bottom on the front side, and over the floor region. A construction advantageous for the operation and function is achieved in that the floor region for guiding the cooling air is provided with a flat floor construction (2) arranged under the introduced container, comprising an inner cover (20) on the cooling space side and a floor side channel section formed under this space guiding the cooling air channel from the front side (8) to the lower rear-side section of the cooling air channel (fig. 1).
