Abstract (en)

[origin: WO2015154951A1] The invention relates to a method for monitoring standstill in rail vehicles using a train control device, and to a corresponding device. To be able to turn off the rail vehicle completely during a standstill phase, and to be able to resume fully monitored operations without the need for staff immediately after the rail vehicle has been turned back on, the invention provides for the detection of the standstill position of the rail vehicle and of a switch position of at least one vehicle-side inertial sensor.
