Abstract (en)

[origin: WO2015121005A1] The invention relates to an arrangement for connecting chassis components, in particular a screw connection, between a structure composed of a fibre-plastic composite (FPC) and a metal load-introducing element designed in particular as a tension member (4), wherein the structure is of double-walled design and has a first wall (2) and an at least further second wall (3) arranged at a distance from the first, wherein the first and the second wall each have coaxially arranged cutouts (2a, 3a), wherein a spacer (5) having a through-hole is arranged between the first and the further wall, wherein the load-introducing element (4) engages through at least one cutout and the hole of the spacer (5), wherein the load-introducing element (4) is assigned a holding member (6), wherein the load-introducing element (4) and the holding member (6) are connected to one another by a connecting portion (7) and wherein the connecting portion (7) and/or the holding member (6) substantially engage through the first and/or the at least further second wall (2, 3).
